A typical use of CAD is to plot and analyze a design idea in order to optimize the design with the least amount of material and the most productive process. CAD software is used by designers, architects, engineers, drafters, product and process builders, and builders of industrial products, for projects ranging from designing buildings to making toys. In 2012, the U.S. construction industry spent over \$250 billion on CAD software. By 2020, Autodesk expects CAD software to represent over 25% of the U.S. construction market. Uses CAD software can be used for: Technical design CAD is primarily used for technical design. For example, when designing an electrical component, electrical engineers would use CAD software to draw, measure, and calculate the design characteristics of the component. The designer would use an electrical CAD package to create a 3-D representation of the component, and then would enter calculations for the properties of the component (such as the electrical resistance of a wire, the capacitance of a capacitor, the magnetic permeability of a magnet, etc.). The resulting design would be checked for flaws in the CAD package, and adjusted as needed. After the design is finalized, the CAD package would be used to create a drawing of the component. The drawing would be given to a draftsman to use with standard engineering tools, such as a milling machine, to produce a prototype of the component. Industrial design CAD software is frequently used by industrial designers. Industrial designers create tools and machines that help with industrial processes. For example, there are CAD packages for the steel industry (Steel CAD), the plastics industry (Plastics CAD), the ceramics industry (Ceram CAD), the medical industry (MRI CAD), etc. Architecture and landscape design Architectural design and land surveying are typically used to create 3-D models of architectural designs. Sometimes, architectural design also requires creating models of cities and the like. Land surveyors often use CAD to plot property boundaries and to mark out property locations. Land surveyors use CAD to detect and repair anomalies (e.g., when detecting a change in terrain from one survey to the next, or when a building or other structure is blocking the view of a distant feature). Product design CAD is used by product designers for creating design concepts for new products. As a result of an extensive user survey, and from information obtained from the Product

I am running the app from IIS 7.5, and would like to be able to access this data outside of the app, such as from a Windows service. For example, I would like to be able to perform the following: `string appDataPath = Path.Combine(HttpContext.Current.Server.MapPath("~/App_Data/"), "FooBar");` My question is, if the site is running from IIS, can I set the app\_data path dynamically? The reason I ask is that the path needs to be set to a fixed value when the site is installed, but needs to be set dynamically if the site is running from a Windows service. A: You cannot. There is an app\_data folder only for an ASP.NET application. It exists in a per-application context and is hidden/inaccessible to users. A: If you're OK with the "security" risk of letting an "external" service use your app\_data folder, you could set the app\_data folder up as a virtual directory on your server (IIS), and have your service access it by using a physical path relative to your server instead of a virtual one: `string appDataPath = Path.Combine(Server.MapPath("~/App_Data/"), "FooBar");` I don't think there's a "quick" way of doing this, though. Alternatively, you could store your app\_data data on a physical server outside of your app's IIS context, and then write a custom handler in your app that takes a "path" parameter and opens up that physical server and copies data to the proper location. A: You could have the service access the site via an

Refine your design with the precision of an optical ruler and auto-matching. Use two sources of linear reference to accurately line up to surface details, such as pipes, posts, and bents. (video: 2:48 min.) A powerful, cloud-enabled Microsoft Surface Studio 2 and Windows 10 laptop enables you to view your AutoCAD drawings in the Cloud on the PC or tablet of your choice. The most powerful auto detection tools on the market. Experience unmatched multi-user productivity. Auto-detect, partition, and operate each user's own personal work space on their own device, while still allowing them to collaborate. Realistic lighting for photo-realistic rendering. The Realistic Light Studio now includes updated outdoor and commercial lighting, reflective surfaces and interiors, industrial lighting and more. More Realistic Materials for Photo-Realistic Rendering. AutoCAD 2023 includes an updated library of materials for more realistic rendering, from metallic, glass, and wood, to stone, leather and carpet. REALISTIC 3D BUILDINGS Add a third dimension to your drawings with 3D building models. Create 3D model versions of your 2D drawings. (video: 1:07 min.) Generate accurate 3D models from 2D drawings, no matter what type of 2D drawing you have. (video: 1:17 min.) 3D models are now editable from the 3D Perspective Toolbar. (video: 1:21 min.) Optimize your 2D CAD drawings with Quick3D. Quickly convert 2D drawings to 3D, create 3D models, or view a 3D model from 2D. (video: 1:16 min.) Add a new level of realism and functionality to your 2D drawings with Quick3D. (video: 1:01 min.) PEPT The new Pept™ Toolkit delivers powerful tools for creating a more effective flow between your ideas and documentation. Structure Pept™ from vertical to horizontal. Create and flow content vertically or horizontally with Pept™. Quickly place graphical annotations at the edge of drawings to alert or inform other team members. (video: 1:25 min.)
